PROFILE

DevSecOps at a state-owned bank in Indonesia (BUMN) since Feb 2024; backend developer 2022–2024.
Own a centralized CI/CD platform: 53 services, 2 CI engines, 5 artefact types, SIT → UAT → PROD.
S1 Informatics, Universitas Tarumanagara, 2018–2022, GPA 3.64.

IMPACT

- Cut release lead time by **~90%**, hours of manual steps to minutes (estimate: ~3 h runbook → ~10–15 min automated); each promotion is time-stamped in the release audit ledger, so the delta is trackable.
- One pipeline standard, specified with system analysts, business analysts and scrum masters, delivers **53 services** from a single pipeline repository: a gate or a fix lands once and reaches every service.
- A **4-person team** operates, releases from and handles incidents on this platform without me; **4 projects** handed over with documentation.
- Security sits in the merge path across a **52-rule** codified standard: fail-closed quality gate, Trivy + Semgrep + SonarQube, SBOM per image, Vault secrets.

EXPERIENCE

DevSecOps, Bank Negara Indonesia (BUMN) · Jakarta, Indonesia Feb 2024–present

- Built and own a centralized CI/CD pipeline gateway delivering 53 services from one repository, rendering OpenShift deployment manifests across 5 artefact types, SIT → UAT → PROD (~9.9k lines of pipeline code written by me).
- Codified a 52-rule pipeline standard and enforced it behind two CI engines (GitLab CI, Jenkins/Groovy shared library) as one contract, so an override reads as an exception, not a silent fork.
- Made security a gate, not a report: composite quality gate that fails closed, SonarQube and Semgrep SAST on the merge path, Trivy scan plus CycloneDX SBOM per image, secrets from Vault.
- Built a ChatOps release orchestrator on Jira + GitLab webhooks and a release control plane (issue board, deployment audit ledger, release emails); promotion is automated up to the approval, which stays human for segregation of duties.
- Root-caused a self-triggering bot loop (substring matching let the orchestrator react to its own replies; hundreds of comments across several tickets overnight) and shipped four layered guards (bot-account exclusion, orchestrator guard, anchored regex, non-re-triggering replies), 25 regression tests and rate watermarks (60 s / 900 s / 120 s). Post-incident review led by the project manager.

Backend Developer, Bank Negara Indonesia (BUMN) · Jakarta, Indonesia Jan 2022–Jan 2024

- Developed backend services in Java Spring Boot and Python for the bank's delivery teams.
- Ran them on OpenShift and OpenFaaS under SonarQube gates, later standardised platform-wide.

SELECTED PLATFORM WORK

- **Centralized pipeline gateway**: 53 services on one versioned contract; onboarding is a service-map entry.
- **ChatOps orchestrator**: deploy, scan and merge from the Jira ticket; bot loop pinned by 25 tests.
- **Release control plane**: deployment audit ledger and release emails; promotion is a tag-and-merge diff.

SKILLS

- **CI/CD automation & platform engineering (daily):** GitLab CI, Jenkins/Groovy library, Bash, Python, pipeline-as-code
- **Containers and platforms (daily):** Docker, OpenShift, Linux, on-premise servers and VMs, Git
- **Security and quality gates (daily):** SonarQube, Semgrep, Trivy, SBOM / CycloneDX, Vault
- **Delivery workflow (daily):** Jira, Firebase, TestFlight
- **Backend (previous role, 2022–2024):** Java Spring Boot, Python

EDUCATION

S1 Informatics (Computer Science), Universitas Tarumanagara, Jakarta 2018–2022 · GPA 3.64 / 4.00

- 1st place, SQL and C++ competition; 2nd place, business-based technology competition.
