IVAN JAIRUS

DevSecOps

Jakarta, Indonesia · filemonivanjairus@gmail.com · linkedin.com/in/ivan-jairus · github.com/IvanJairus · ivanjairus.xyz

PROFILE

DevSecOps at Bank Negara Indonesia (BNI), a state-owned bank, since 2024; backend developer 2022–2024.

Own a centralized CI/CD platform: **53 services**, 2 CI engines, 5 artifact types, SIT → UAT → PROD.

IMPACT

- Cut release lead time by **~90%**, from ~3 h of manual runbook steps to ~10–15 min automated; each promotion is time-stamped in the release ledger, so the delta is trackable.
- One pipeline standard, specified with system analysts, business analysts and scrum masters, delivers **53 services** from one repository: a gate or a fix lands once and reaches every service.
- A **4-person team** now operates and releases from the platform without me; 4 projects handed over with documentation.
- Security sits in the merge path across a **52-rule** standard: fail-closed quality gate, Trivy + Semgrep + SonarQube, SBOM per image, Vault secrets.

EXPERIENCE

DevSecOps, Bank Negara Indonesia (BNI) · Jakarta, Indonesia Feb 2024–present

- Built and own a centralized CI/CD pipeline gateway delivering 53 services from one repository, rendering OpenShift deployment manifests across 5 artifact types, SIT → UAT → PROD.
- Codified a 52-rule pipeline standard and enforced it behind two CI engines (GitLab CI, Jenkins/Groovy shared library) as one contract, so an override reads as an exception, not a silent fork.
- Made security a gate, not a report: fail-closed composite gate, SonarQube and Semgrep SAST on the merge path, Trivy scan plus CycloneDX SBOM per image, secrets from Vault.
- Built a ChatOps release orchestrator on Jira + GitLab webhooks and a release control plane (issue board, release ledger, release emails); promotion is automated up to the approval, which stays human for segregation of duties.
- Root-caused an automation incident, shipped layered safeguards and regression tests, and documented the failure mode for the runbook.
- Wrote architecture, release-flow and incident runbooks, and mentored the engineers who took over the platform.

Backend Developer, Bank Negara Indonesia (BNI) · Jakarta, Indonesia Jan 2022–Jan 2024

- Developed backend services in Java Spring Boot and Python for the bank's delivery teams.
- Ran them on OpenShift and OpenFaaS under SonarQube gates, later standardized platform-wide.

SKILLS

- **CI/CD automation & platform engineering (daily):** GitLab CI, Jenkins/Groovy library, Bash, Python, pipeline-as-code
- **Containers and platforms (daily):** Docker, OpenShift, Linux, on-premises servers and VMs, Git
- **Security and quality gates (daily):** SonarQube, Semgrep, Trivy, SBOM / CycloneDX, Vault
- **Delivery workflow (daily):** Jira, Firebase, TestFlight
- **Backend (previous role, 2022–2024):** Java Spring Boot, Python

EDUCATION

Bachelor's in Informatics, Universitas Tarumanagara, Jakarta 2018–2022 · GPA 3.64 / 4.00

- 1st place, SQL and C++ competition; 2nd place, business-based technology competition.
