PROFILE

DevSecOps at Bank Negara Indonesia (BNI), a state-owned bank, since Feb 2024; backend developer 2022–2024.

Built and own a centralized CI/CD platform serving **50+ services** on GitLab CI and Jenkins, SIT → UAT → PROD.

S1 Informatics, Universitas Tarumanagara, 2018–2022, GPA 3.64.

IMPACT

- Release lead time cut from **hours of manual steps to minutes**.
- **50+ services** deploy through one shared pipeline repository: adding a service takes configuration, not a new pipeline built from scratch.
- The architecture is **stable in production**: one release flow and one set of quality gates across all artefact types and three environments, with no special path per team.

EXPERIENCE

DevSecOps, Bank Negara Indonesia (BNI) · Jakarta, Indonesia Feb 2024–present

- Developed dozens of pipelines with thousands of lines of code in total: build and release for backend artefacts (jar and container image), mobile builds (apk/aab and ipa) through tester distribution, stage templates per artefact type, environment promotion, quality gates and release reporting.
- Built and own a centralized CI/CD pipeline gateway that delivers 50+ services from one repository, rendering OpenShift deployment manifests across several artefact types, SIT → UAT → PROD.
- Codified a 50+ rule pipeline standard; the same standard runs as one workflow on two CI engines (GitLab CI, Jenkins/Groovy shared library).
- Made security a gate, not a report: composite quality gate that fails closed, SonarQube and Semgrep SAST on the merge path, vulnerability scan plus CycloneDX SBOM on every container image, secrets from Vault. Each CRITICAL finding points to the exact code or image location, so the developer knows what to fix.
- Built a ChatOps release orchestrator on Jira + GitLab webhooks and a release control plane (issue board, release ledger, release emails); promotion is automated up to the approval, which stays human for segregation of duties.
- Wrote documentation and runbooks for every project I held: the architecture design, the release flow, and the operational steps the team follows when something goes wrong.

Backend Developer, Bank Negara Indonesia (BNI) · Jakarta, Indonesia Jan 2022–Jan 2024

- Developed backend services in Java Spring Boot and Python for the bank's delivery teams.
- Ran them on OpenShift and OpenFaaS under SonarQube gates, later standardised platform-wide.

SKILLS

- **Daily use:** GitLab CI, Bash, Python, pipeline design, Semgrep and SonarQube SAST, Vault, Docker and registry, Linux, Git, multi-artefact delivery, mobile build distribution (Firebase, TestFlight)
- **Regular use:** Jenkins/Groovy shared library, Trivy container scanning, CycloneDX SBOM, OpenShift, on-premise VMs, rendered manifest templating
- **Previous role, 2022–2024:** Java Spring Boot, OpenFaaS, Python backends

EDUCATION

S1 Informatics (Computer Science), Universitas Tarumanagara, Jakarta 2018–2022 · GPA 3.64 / 4.00

- 1st place, SQL and C++ competition; 2nd place, business-based technology competition.
